

Customer Experience Issues

Simple help guide for billing, calls, data, activation, and roaming problems

1. Billing / Charging Errors

What this means: Your bill is higher than expected, you were charged for something you did not use, or a recharge did not reflect.

Step 1: Open the app or log in to the website and go to 'Bill Details' or 'Usage History' to see exactly what you were charged for.

Step 2: Check if you activated any extra packs (data add-ons, international packs) that you may have forgotten about.

Step 3: If a recharge did not reflect: wait up to 2 hours. If still missing, share your payment reference number (from your bank or UPI app) when raising a ticket.

Step 4: For overcharges: take a screenshot of the incorrect amount and raise a billing dispute ticket.

Step 5: For refunds: all valid refund requests are processed within 5–7 working days to your original payment method.

Step 6: Late fee waiver: if this is your first late payment, contact us — we can usually waive it as a one-time exception.

Step 7: You will NOT be disconnected while a billing dispute is under review.

■ Always keep your payment receipts or screenshots from UPI/bank apps. They help us resolve billing disputes much faster.

2. Call Drops / Poor Call Quality

What this means: Your calls keep cutting off unexpectedly, voice sounds robotic or echo-y, or the other person cannot hear you clearly.

Step 1: Restart your phone and try the call again.

Step 2: Move to an open area — walls, ceilings, and crowds absorb mobile signals.

Step 3: Try enabling HD calls (VoLTE): Settings → Mobile Network → Enable VoLTE or HD Voice → ON.

Step 4: Check your phone case — thick metal cases can block signal. Try removing it temporarily.

Step 5: If calls drop only at one specific location (like your office or home), Wi-Fi calling is the best solution — enable it in Settings.

Step 6: If call quality is poor with everyone you call, not just one person, the issue is on your end or the network.

Step 7: If call quality is poor only when calling one specific number, the issue may be on their end — ask them to check their phone.

Step 8: Raise a ticket if call drops happen more than 5 times a day consistently.

■ ■ Wi-Fi calling is a free feature that uses your home Wi-Fi for crystal-clear calls — perfect for areas with weak signal indoors.

3. Slow Data / Data Throttling

What this means: Your mobile internet was fast before but has suddenly become very slow. This can happen when your high-speed data limit is reached.

Step 1: Check your data balance: dial *123# or check the app. If your high-speed data is used up, your speed is reduced until the next billing cycle or until you recharge.

Step 2: To restore full speed immediately: buy a data top-up or add-on pack from the app.

Step 3: If your balance shows data is available but speed is still slow: restart your phone.

Step 4: Turn mobile data OFF and back ON — this refreshes the data connection.

Step 5: Check if any app is downloading updates in the background — pause them.

Step 6: If speed is slow only on certain apps (like YouTube but not WhatsApp), those apps may have their own settings to check.

Step 7: If full speed does not return even after recharging, raise a ticket — something may need resetting on our end.

Data speed guide:

Speed You Are Getting	Likely Reason	Fix
Very fast (normal)	All good, data available	No action needed
Suddenly very slow	High-speed data used up	Recharge or buy add-on
Slow only indoors	Weak signal inside building	Enable Wi-Fi or move
Slow in a specific area	Network congestion	Try again later
Slow after changing phone	APN settings not set	Call us for auto-config

4. New SIM / Plan Activation Not Working

What this means: You got a new SIM card or changed your plan but services have not started yet.

Step 1: New SIM activation can take up to 4 hours after purchase — please wait before raising a ticket.

Step 2: Restart your phone after inserting the new SIM.

Step 3: Make sure the SIM is inserted correctly — remove and reinsert if needed.

Step 4: Check that the SIM tray is for the correct size (nano/micro/standard) — a wrong-sized SIM will not work.

Step 5: For plan changes: new plan benefits (data, calls) will show in the app within 2 hours of activation.

Step 6: If activation takes more than 6 hours: call customer care with your SIM number (printed on the SIM pack) and your ID proof number.

Step 7: New customers: complete KYC (identity verification) is mandatory. If you skipped a step, activation will be on hold.

■■ Keep your SIM pack safely — it has your SIM number printed on it, which you will need if you contact customer care.

5. Roaming / Using Phone Abroad Not Working

What this means: You are travelling outside India and your phone is not connecting to a local network, or you are being charged very high rates.

Step 1: Before travelling: activate an International Roaming Pack from the app or by calling us — it gives you fixed-price calls and data abroad.

Step 2: After landing: turn your phone OFF and back ON — this forces it to connect to a local network abroad.

Step 3: Go to Settings → Mobile Network → Network Selection → Automatic.

Step 4: Enable Data Roaming: Settings → Mobile Network → Data Roaming → ON.

Step 5: If still no connection: go to Settings → Mobile Network → manually search for networks and select one.

Step 6: Avoid using data abroad WITHOUT a roaming pack — charges can be very high.

Step 7: To call India for free from abroad: use WhatsApp or similar apps over Wi-Fi or your roaming data pack.

Step 8: If roaming pack was activated but not working: call our international helpline (works from abroad, toll-free).

■■ Always activate a roaming pack BEFORE you travel. Activating it after landing in another country may take up to 2 hours to kick in.
